

8051 LCD interfacing

=

→ 16x2 LCD

↓ 2 line

16 characters / line

→ each character 5x7 pixel matrix

→ LCD : 2 registers

• predefined tasks

• clear screen
• set cursor ---

Data bus:

3 control lines: RS, R/W, E

8 data lines: D0-7

∴ 11 lines.

required commands

0x80 : force cursor to 1st line

0xC0 : force cursor to beginning of 2nd line

0x38 : 2 lines, 5x7 matrix chara. 8 bit mode

0x0E : display, cursor on

0x06 : entry mode (increment cursor)

0x01 : clear displays

command lcd

~~~~~

RS = 0 ; // command register

RW = 0 ; // write command

EN = 1 ;

delay();

EN = 0 ;

} to send.

VSS: ground

VDD: supply voltage

VEE: adjust contrast (using a potentiometer)

RS: register select  
→ 0: command reg  
→ 1: data reg

RW: → 0: write  
→ 1: read

E: enable; send data to pins  
uses high to low pulse

D0-7: 8 data pins.

code: RS mostly 0 as only one command

=

send data

→ put write to data pins then send by -1e edge of enable.

RS = 1 ; // data register

RW = 0 ; // write

[ en = 1 ;  
delay();  
en = 0 ; ] to send

6051 F8I

Fire: destructive, toxic fumes etc.

Flame  $\leftrightarrow$  visible portion of fire.

characteristics  $\rightarrow$  production of heat  
 $\rightarrow$  emission of gases  
 $\rightarrow$  emission of light (IR/UV)

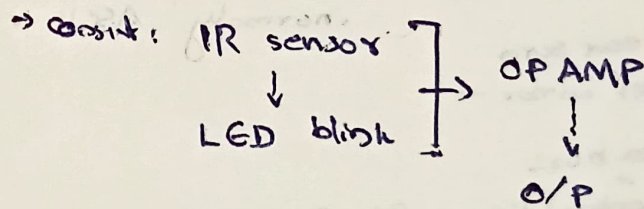

Flame detectors

Sensing using IR radiation from flame  
 $\rightarrow$  90% of flames total radiation is IR

$\rightarrow$  detect fire or any light source

$\lambda$  range 760nm to 1100nm.

$\rightarrow$  potentiometer: vary sensitivity
